Temperature Monitoring

Checking and Recording Temperatures at Least Twice a Day

The recommended method to ensure that a refrigerator or freezer is maintaining the proper temperature for vaccine storage is to check and record the temperature at least twice a day. This recommendation applies regardless of whether or not there is a temperature alarm, a chart recorder thermometer, or a digital data logger.

Check and record temperatures at least twice a day.

- 1. Post a temperature log on the vaccine storage unit door (see <u>Fahrenheit Temperature</u> Log and <u>Celsius Temperature Log</u> in the Resources section).
- 2. Read the thermometers in both the refrigerator and freezer at least twice a day: once in the morning when the storage unit door is opened for the first time, and again at the end of the clinic day just before the storage unit door is closed for the last time. (See <u>How to Read a Fluid-Filled Biosafe Liquid Thermometer</u>, <u>How to Read a Liquid Minimum/Maximum Thermometer</u>—Print Version, <u>How to Read a Liquid Minimum/Maximum Thermometer</u>—Animated Version, <u>How to Read a Chart Recorder</u>—Print Version, and <u>How to Read a Chart Recorder</u>—Animated Version in the Resources section for details).
- 3. Record the temperatures in both the refrigerator and freezer on the temperature log each time the thermometers are read. Twice daily temperature monitoring and recording is required even if a continuous graphing/recording thermometer or a digital data logger is used.

- 4. Record the times the thermometers were read, and have the person reading the thermometer and recording the temperature initial the temperature log.
- 5. If a temperature reading is missed, the blank log entry should remain blank. Do not guess what the temperature was.

Do not faithfully record the temperatures on the log and then fail to take action when the temperature in either the refrigerator or freezer is outside the recommended range for vaccine storage. **Immediate action** must be taken to protect the vaccines. Furthermore, this action should be documented (see <u>Handling Inappropriate Vaccine Storage Conditions [Light and Temperature]</u> in the Storage Troubleshooting section for details).

Reviewing Temperature Logs

If other staff are monitoring and recording the temperatures, the primary vaccine coordinator should review the log weekly to ensure proper temperature recording. If the vaccine

The primary vaccine coordinator should coordinator is the person monitoring and review the log weekly to ensure proper temperature recording.

Noting Equipment Failures and Room Temperatures

The date and time of any mechanical malfunction or power outage should be recorded. This information may be recorded on the temperature log or on some other document, for example the <u>Emergency Response Worksheet</u> in the Resources section. As with inappropriate storage temperatures, **Mimmediate action** must be taken to correct these situations. See <u>Handling</u> <u>Malfunctioning Vaccine Storage Units</u> and <u>Power Outages</u> in the Storage Troubleshooting section for further details.

If a mechanical malfunction or power outage has occurred, the room temperature where the vaccine storage unit is kept should also be recorded. If the cold chain is broken, the room temperature is useful information that will help the vaccine coordinator, the health department officials, and/or the vaccine manufacturer decide how best to handle compromised vaccine. Have a thermometer in the room for measuring the room temperature—a standard household thermometer (the sort you find in a hardware store) is fine for this purpose. **Do not** remove

refrigerator or freezer to measure the room temperature. **Do not** rely on the room thermostat setting.

the certified calibrated thermometer from the If a mechanical malfunction or power outage has occurred, the room temperature where the vaccine storage unit is kept should also be recorded.

Maintaining Temperature Logs

Maintain an ongoing file of temperature logs and store completed logs for 3 years (unless state statutes or rules require a longer period). Do not throw away temperature logs before 3 years. As the vaccine storage unit ages, you can track recurring problems or identify how long

Store completed logs for 3 years (unless state statutes or rules require a longer period).

problems have existed by referring to old temperature logs. If a continuous recording/graphic thermometer is used, the graphs should be kept with the logs for 3 vears.

Using Alarm Systems

Facilities storing large vaccine inventories may want to consider installing continuous monitoring temperature alarm systems to help prevent substantial financial loss if the temperatures in their storage units exceed the recommended ranges or if the storage

units malfunction. See <u>Temperature Alarms</u> in the Vaccine Storage Equipment section for more details. If alarm systems are used, temperatures must still be checked and recorded twice a day.

If alarm systems are used, temperatures must still be checked and recorded twice a day.
